Brian Leung [¶]

ICPSR Session 2 (July 19, 2021)

Abstract

This course introduces methods and concepts used to infer causal effects from comparisons of intervention and control groups. We'll use the potential outcomes framework of causality to analyze both randomized and observational studies, distinguishing different forms of random assignment and separating observational studies that involve instruments, discontinuities and other devices, highlighting the interplay of study design for statistical analysis. Propensity score matching is treated in depth, with explicit instruction in the use of "optmatch" and related packages in R; other areas of methodological focus include assessment of covariate balance by specification tests and other methods; inference methods that are a robust to small sample sizes, weak instruments, spillover and interaction effects, heterogeneous treatment effects, and/or misspecification of response surfaces; and omitted variable sensitivity analysis.

The course presupposes knowledge of multiple regression at the level of the ICPSR course Regression: II, as well as multiple regression with binary dependent variables (as taught in the ICPSR courses Regression: III or Maximum Likelihood). The part of the course presenting matching requires the use of `R` for computation, but other methods presented in the course are readily implemented either in `R` or in `Stata`.

The course meets 3–5 pm US Eastern Time, Monday through Friday, from July 19 through August 12. There will be no class on August 13, the final day of the course. Ben is the primary instructor for the first day of the course, Tom for the next four and then Jake for the final three weeks. Tom, Sanghoon, and Brian and will be the TAs for the duration of the course.

You can sign up for office hours with Jake at https://calendly.com/jakebowers/icpsr-office-hours. Ben's office hours are first come first serve, at times and Zoom rooms as posted to the course Canvas site.

Overview

We may all warn our freshmen that association is not causation, but inferring causation has always been a central aim both for statisticians and for their collaborators. Until recently, however, inference of causation from statistical evidence depended on murky, scarcely attainable requirements; in practice, the weight of casual arguments was largely determined by the scientific authority of the people making them.

Requirements for causal inference become more clear when they are framed in terms of *potential outcomes*. This was first done by Neyman, who in the 1920s used potential outcomes to model agricultural experiments. Fisher independently proposed a related but distinct, ultimately more influential, analysis of experiments in 1935, and a rich strain of causal analysis developed among his intellectual progeny. It clarified the differing requirements for causal inference with experiments and with observational data, isolating the distinct contributions required of the statistician and of his disciplinary collaborators; generated more satisfying methods with which to address potential confounding due to measured variables; qualitatively and quantitatively advanced our grasp of unmeasured confounding and its potential ramifications; furnished statistical methods with which to eke more out of the strongest study designs, under fewer assumptions; and articulated principles with which to understand study designs as a spectrum, rather than a dichotomy between "good" experiments and "bad" observational studies. Understanding the methods and outlook of the school founded by Fisher's student W. G. Cochran will be the central task of this course.

The course begins by applying the Fisher and Neyman-Rubin approaches to statistical inference for counterfactual causal efffects to randomized experiments, touching on considerations specific to clustered treatment assignment, "small" sample sizes and treatment effect heterogeneity. The next segment addresses conceptual and methodogical challenges of applying the same models to analysis of non-experimental data. This course segment covers ignorability, selection, "common support," covariate balance, paired comparisons, optimal matching and propensity scores. A short separate section introduces another method aiming to identify experiment-like structures in observational data, namely regression discontinuity, before a return to experiments.

With these foundations in place, the course's second half adds conceptual depth and methodological flexibility. Central topics include instrumental variables and local average treatment effects, stratified designs with clustering, interference, omitted variable sensitivity analysis and adapting workhorse techniques such as multiple regression to the demands of causal inference. Over the course of the four weeks the course becomes progressively less conceptual and more applied with increasing emphasis on computing strategies in R.

Administrative

Textbooks

The main texts for the course are

> Paul R Rosenbaum. *Observation and Experiment: An Introduction to Causal Inference*. Harvard University Press, Cambridge, MA, 2017

Paul R Rosenbaum. *Design of Observational Studies*. Springer, New York, NY, 2010

Paul R Rosenbaum. *Observational Studies*. Springer, New York, NY, second edition, 2002

These three textbooks are presented in varying difficulty and we will draw from all three. Although we won't follow these books closely, their goals and methods align with the course's, and they will be useful as references and supplements.

Other texts that we draw on include

Alan S Gerber and Donald P Green. *Field Experiments: Design, Analysis, and Interpretation*. W.W. Norton, New York, NY, 2012

Guido W Imbens and Donald B Rubin. *Causal Inference for Statistics, Social, and Biomedical Sciences: An Introduction*. Cambridge University Press, New York, NY, 2015

Other readings will be assigned and distributed electronically.

If you're new to `R`, we suggest getting a hold of:

John Fox. *Applied Regression Analysis and Generalized Linear Models*. SAGE Publications, Los Angeles, CA, 3rd edition, 2016

Hadley Wickham and Garrett Grolemund. *R for Data Science: Import, Tidy, Transform, Visualize, and Model Data*. O'Reilly Media, Sebastopol, CA, First edition, 2017

`R` software will be required for several specific segments of the course. With some independent effort, students not familiar with `R` in advance should be able to learn enough `R` during the course to complete these assignments. We also recommend some work with `R` — for example, via working through some online `R` courses — before the course for students who have never used it before.

Assignments

Assignments are due each Tuesday, at the beginning of class. Parts of the assignment will be given at the beginning of the week, but other parts will be given during class, over the course of the week. Many of these daily assignments will be given with the expectation that they'll be completed by the next course meeting, although they'll only be collected at the end of the week. Late homework will not be accepted without cause (or prior arrangement with the teaching assistant).

You're welcome to submit a paper at the end of the course, whether or not you're taking the course for credit. In that case we'll return it with comments within a month or so of the course's completion. (If you're taking the course for a grade, the paper won't contribute to the grade unless you're on the borderline between two grades.)

Participation is expected. It can take various forms:

1. Doing in-class exercises and discussing them with your peers;

2. From time to time, making a clarification or raising a clarifying questions;

3. Contributing to in-class discussions.

4. Drop by one of the professor's office hours to share a point that you *and at least one class-mate* would like to have clarified or amplified, or to point out a connection to your field;

If you are taking the course for a grade, make a point of doing at least one of 3 and 4.

Course Schedule

The course schedule is below. In the Course content section, we provide more extensive readings on each topic in the schedule, as well as additional "special topics." The last two days of the course are reserved for special topics chosen by students.

Date	Instructor	Topic	Required readings	Application
July 19	Ben Hansen	Introduction	Holland (1986) Kinder and Palfrey (1993, Section 1.2) Fisher (1935, Introduction) Rosenbaum (2017, Chapter 2)	N/A
July 20	Tom Leavitt	Randomized experiments: Neymanian Estimation and inference	Gerber and Green (2012, Chapter 2) Aronow and Middleton (2013) Middleton and Aronow (2015) Gerber and Green (2012, pp. 51 – 61)	Arceneaux (2005)
July 21				
July 22	Tom Leavitt	Randomized experiments: Fisherian inference	Rosenbaum (2017, Chapter 3)	
July 23	Tom Leavitt	Randomized Experiments: Covariance adjustment & regression	Gerber and Green (2012, Chapter 4) Rosenbaum (2002) Lin (2013)	
July 26	Ben Hansen	Randomized experiments: Noncompliance and attrition	Gerber and Green (2012, Chapters 5 – 6) Rosenbaum (1996) Rosenbaum (2010, Section 5.3)	Albertson and Lawrence (2009)
July 27 (HW 1 due)	Jake Bowers			
July 28	Jake Bowers	Observational studies: Introduction	Bind and Rubin (2019) Gelman and Hill (2006, Sections 9.0 – 9.2) Berk (2010)	Cerdá et al (2012)
July 29	Jake Bowers	Introduction to matching	Rosenbaum (2017, pp. 65 – 90)	
August 2	Jake Bowers	Nuts & bolts of matching	Rosenbaum (2010, Chapters 7 – 8) Rosenbaum (2017, Chapter 11)	
July 30	Jake Bowers	Propensity score methods	Rosenbaum (2017, pp. 90 – 96) Hansen (2011)	
August 3 (HW 2 due)	Jake Bowers	Assessments of covariate balance	Hansen and Bowers (2008)	
August 4	Jake Bowers	Outcome analysis after matching	Gerber and Green (2021, pp. 71 – 79)	
August 5	Jake Bowers	Nonbipartite matching	Rosenbaum (2010, Chapter 11)	Wong et al (2012, 2020)
August 6	Jake Bowers	Regression discontinuity designs and "natural experiments"	Cattaneo, Titiunik, and Vazquez-Bare (2020) Keele, Titiunik and Zubizarreta (2015) Sales and Hansen (2020)	Caughey and Sekon (2011)
August 9	Tom Leavitt	Fisherian sensitivity analysis	Rosenbaum (2017, Chapter 9)	Cerdá et al (2012)
August 10 (HW 3 due)	Tom Leavitt	Neymanian sensitivity analysis	Fogarty (2020)	
August 11	Jake or Tom	Special topics	TBD	TBD
August 12	Jake or Tom	Special topics	TBD	TBD

Course content

1   Potential outcomes and random assignment

Required

Paul W Holland. Statistics and causal inference. *Journal of the American Statistical Association*, 81(396):945–960, 1986, Sections 1 – 4. (The article that brought the "Rubin Causal Model" to statisticians' attention.)

Section 1.2, "Experimentation defined," of Donald R Kinder and Thomas R Palfrey. On behalf of an experimental political science. In Donald R Kinder and Thomas R Palfrey, editors, *Experimental Foundations of Political Science*, Michigan Studies in Political Analysis, chapter 1, pages 1–39. University of Michigan Press, Ann Arbor, MI, 1993. (Particularly pp. 5 – 10.)

Paul R Rosenbaum. *Observation and Experiment: An Introduction to Causal Inference*. Harvard University Press, Cambridge, MA, 2017, Chapter 2.

Chapter 1, "Introduction," of Ronald Aylmer Fisher. *The Design of Experiments*. Oliver and Boyd, Edinburgh, SCT, 1935 and pages 131 – 135 of Joan Fisher Box. *R. A. Fisher, the Life of a Scientist*. Wiley, New York, NY, 1978 for historical context.

Recommended

Jake Bowers and Thomas Leavitt. Causality and design-based inference. In Luigi Curini and Robert Franzese, editors, *The SAGE Handbook of Research Methods in Political Science and International Relations*, volume 2, chapter 41, pages 769–804. SAGE Publications, Thousand Oaks, CA, 2020

2   Random assignment as a basis for inference

Application

Kevin Arceneaux. Using cluster randomized field experiments to study voting behavior. *The Annals of the American Academy of Political and Social Science*, 601(1):169–179, 2005

2.1   Inference for causal effects: the Neyman tradition

2.1.1   Estimation of average causal effects

Required

Chapter 2 and pp. 51 – 61 of Alan S Gerber and Donald P Green. *Field Experiments: Design, Analysis, and Interpretation*. W.W. Norton, New York, NY, 2012

Peter M Aronow and Joel A Middleton. A class of unbiased estimators of the average treatment effect in randomized experiments. *Journal of Causal Inference*, 1(1):135–154, 2013

Joel A Middleton and Peter M Aronow. Unbiased estimation of the average treatment effect in cluster-randomized experiments. *Statistics, Politics and Policy*, 6(1-2):39–75, 2015

2.1.2 Variance estimation and hypothesis testing

Required

Chapter 3 of Alan S Gerber and Donald P Green. *Field Experiments: Design, Analysis, and Interpretation*. W.W. Norton, New York, NY, 2012.

Endnote spanning pages A-32 and 33, David A Freedman, Robert Pisani, and Roger Purves. *Statistics*. W. W. Norton & Company, New York, NY, 3rd edition, 1998. (This can be read as a précis of: Jerzy Splawa-Neyman, D M Dabrowska, T P Speed, et al. On the application of probability theory to agricultural experiments. essay on principles. section 9. *Statistical Science*, 5(4):465–472, 1990.)

Chapter 6, pp. 87 – 98 of Guido W Imbens and Donald B Rubin. *Causal Inference for Statistics, Social, and Biomedical Sciences: An Introduction*. Cambridge University Press, New York, NY, 2015

Recommended
